第9章控制系统的状态空间分析

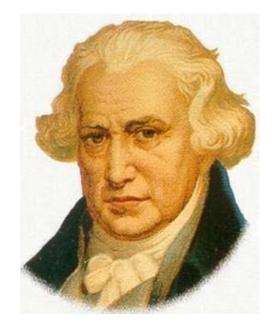

Chapter 9 Analysis of Control Systems in State Space

刘Sir: liulei@mail.hust.edu.cn

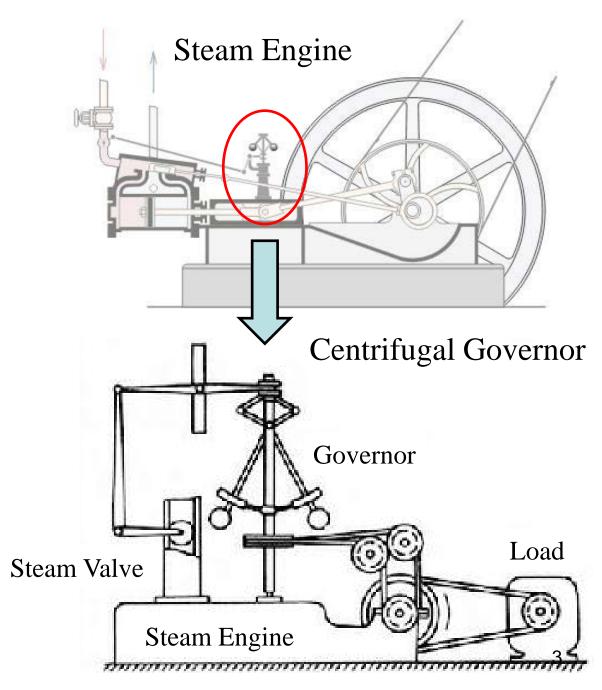

Chapter 9 Analysis of Control Systems in State Space

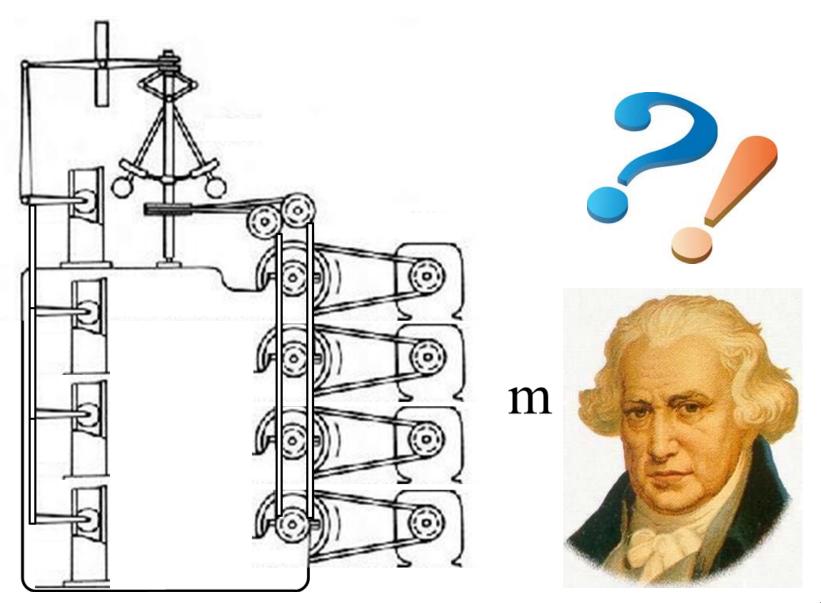

- 9.1 Introduction
- 9.2 State-Space and State-Equation
- 9.3 State-Space Establishing of Linear System
- 9.4 Solving the Linear Time-Invariant State Equation
- 9.5 Controllability and Observability
- 9.6 Feedback Structure and State-Observers

Mr. J. Watt

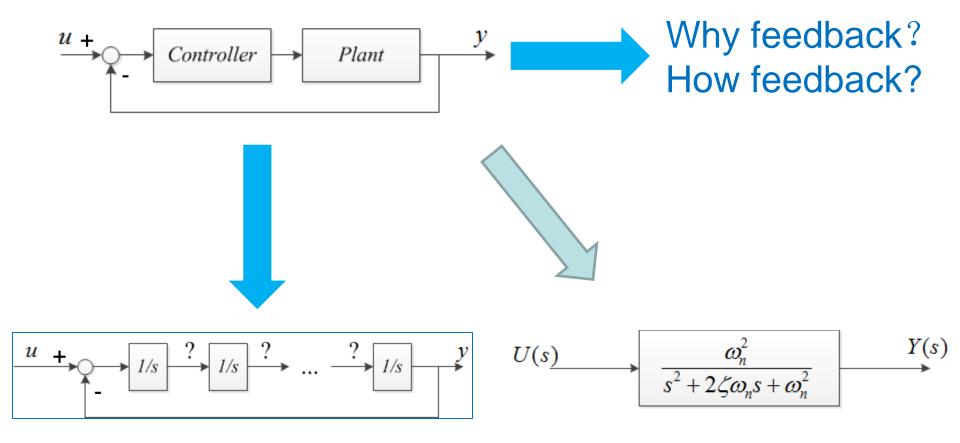

n

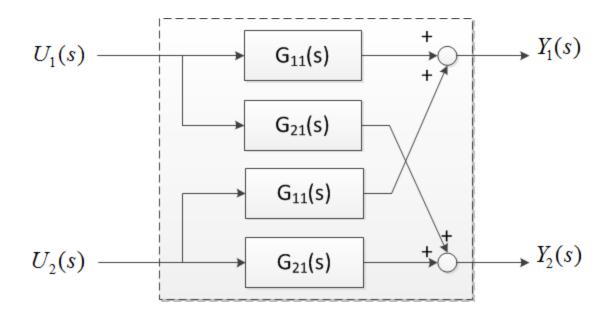

Why Modern Control Theory?

1. Result and Process

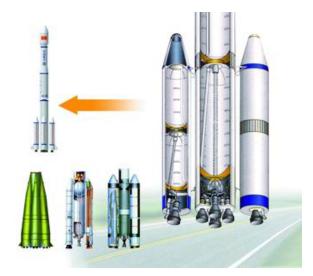

What about the intermediate states?

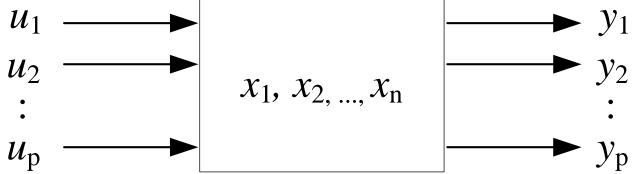

• 2. Internal relationship and Coupling(耦合)

• 3. Aerospace science requirement

Areas:

- Aerospace Science;
- Robotics;
- Industry;

Benefit:

- Mathematical Tools
- Theory Fundation
- Research Method
- ❖ External Information(外部信息)(Input&Output Variable)
 Internal Information (内部信息)(State Variable)

Chapter 9 Analysis of Control Systems in State Space

- 9.1 Introduction
- 9.2 State-Space and State-Equation
- 9.3 State-Space Establishing of Linear System
- 9.4 Solving the Linear Time-Invariant State Equation
- 9.5 Controllability and Obserability
- 9.6 Feedback Structure and State-Observers

9.2 State Space and State Equation

9.2.1 Concepts

- 1. State: In time domain, a set (集合) of variables to describe System's motion and movement information
- 2. State-variable: the smallest set of variables that describe the "state" of a system. Intuitively, the state of a system describes enough about the system to determine its future behavior. In an nth-order differential equation there should be n independent state variables.

Attention:

State-variable is Sufficient and Necessary to describe dynamic motion of the system.(NSC-必要充分条件) State-variable is not unique

3. State-vector: n states variables: $x_1(t)$, $x_2(t)$, ..., $x_n(t)$ to describe the observed states in State space.

$$X(t) = [x_1(t), x_2(t), \dots, x_n(t)]^T$$

- 4. State-space: The n dimension space based on the state-variable $x_1(t), x_2(t), \dots, x_n(t)$.
- 5. State-locus: At special time t_0 , the state $x(t_0)$ will be a point in the state-space; during a period of time t, the state x(t) will be draw as a trajectory/locus.
- 6. State-equation: The mathematical relationship between two or more state functions, relationship between state variables and the input:

$$\dot{x}(t) = f[x(t), u(t)]$$

$$x(t_{k+1}) = f[x(t_k), u(t_k)]$$

 Output-equation: Describe the relationship between the Output and State, and between Output and Input.

$$y(t) = g[x(t), u(t)]$$
$$y(t_k) = g[x(t_k), u(t_k)]$$

8. State-space Representation: Represent the system by the State-equations and Output-equations.

$$\begin{cases} \dot{x}(t) = f[x(t), u(t)] \\ y(t) = g[x(t).u(t)] \end{cases}$$

$$\begin{cases} x(t_{k+1}) = f[x(t_k), u(t_k)] \\ y(t_k) = g[x(t_k), u(t_k)] \end{cases}$$

State-space Representation

$$\begin{cases} \dot{x}(t) = f[x(t), u(t)] \\ y(t) = g[x(t), u(t)] \end{cases}$$

f and g are linear function, for linear system.

State-equation: a first-order differential equation.

Output-equation: algebraic equation(代数方程) for vectors.

$$\begin{cases} \dot{X}(t) = A(t)x(t) + B(t)u(t) \\ Y(t) = C(t)x(t) + D(t)u(t) \end{cases}$$

$$\begin{cases} \dot{X}(t) = Ax(t) + Bu(t) \\ Y(t) = Cx(t) + Du(t) \end{cases}$$
Linear Time-Invariant System

- State-equation: Relationship between the Input and State
 - For single-input linear time-invariant system

$$\begin{cases} \dot{x}_{1}(t) = a_{11}x_{1}(t) + a_{12}x_{2}(t) + \dots + a_{1n}x_{n}(t) + b_{1}u(t) \\ \dot{x}_{2}(t) = a_{21}x_{1}(t) + a_{22}x_{2}(t) + \dots + a_{2n}x_{n}(t) + b_{2}u(t) \\ \vdots \\ \dot{x}_{n}(t) = a_{n1}x_{1}(t) + a_{n2}x_{2}(t) + \dots + a_{nn}x_{n}(t) + b_{n}u(t) \end{cases}$$

The constant coefficients $a_{11},...,a_{nn}$; $b_1,...,b_n$ are decided by system characters.

Matrix expression: $\dot{x}(t) = Ax(t) + bu(t)$

$$x(t) = \begin{pmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{pmatrix}, \dot{x}(t) = \begin{pmatrix} \dot{x}_1 \\ \dot{x}_2 \\ \vdots \\ \dot{x}_n \end{pmatrix}, A = \begin{pmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \ddots & \ddots & \vdots \\ a_{n1} & a_{n2} & \dots & a_{nn} \end{pmatrix}, b = \begin{pmatrix} b_1 \\ b_2 \\ \vdots \\ b_n \end{pmatrix}$$

For multi-input Linear Time-Invariant System

$$\begin{cases} \dot{x}_1 = a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n + b_{11}u_1 + b_{12}u_2 + \dots + b_{1p}u_p \\ \dot{x}_2 = a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n + b_{21}u_1 + b_{22}u_2 + \dots + b_{2p}u_p \\ \vdots \\ \dot{x}_n = a_{n1}x_1 + a_{n2}x_2 + \dots + a_{nn}x_n + b_{n1}u_1 + b_{n2}u_2 + \dots + b_{np}u_p \end{cases}$$

Matrix expression: $\dot{x}(t) = \mathbf{A}x(t) + \mathbf{B}u(t)$

In which

$$\mathbf{x} = \begin{pmatrix} x_{1} \\ x_{2} \\ \vdots \\ x_{n} \end{pmatrix}, \dot{\mathbf{x}} = \begin{pmatrix} \dot{x}_{1} \\ \dot{x}_{2} \\ \vdots \\ \dot{x}_{n} \end{pmatrix}, \mathbf{A} = \begin{pmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \vdots & \vdots \\ a_{n1} & a_{n2} & \cdots & a_{nn} \end{pmatrix}, \\
\mathbf{B} = \begin{pmatrix} b_{11} & b_{12} & \cdots & b_{1p} \\ b_{21} & a_{22} & \cdots & b_{2p} \\ \vdots & \vdots & \vdots & \vdots \\ b_{n1} & b_{n2} & \cdots & b_{nn} \end{pmatrix}, \mathbf{u} = \begin{pmatrix} u_{1} \\ u_{2} \\ \vdots \\ u_{n} \end{pmatrix}$$

Output-equation: relationship between Output & State, and Output & Input.

Output is decided by system task.

 General form Output-equation for single-out linear time-invariant system (单输出线性定常系统)

$$y(t) = c_1 x_1(t) + c_1 x_2(t) + \dots + c_n x_n(t) + du(t)$$

The constant coefficients $c_1, c_2, ..., c_n$ and d are relative with the system character.

The Matrix representation:

$$y(t) = \mathbf{c}x(t) + du(t)$$

– General Output function of MIMO system:

$$\begin{cases} y_1 = c_{11}x_1 + c_{12}x_2 + \dots + c_{1n}x_n + d_{11}u_1 + d_{12}u_2 + \dots + d_{1p}u_p \\ y_2 = c_{21}x_1 + c_{22}x_2 + \dots + c_{2n}x_n + d_{21}u_1 + d_{22}u_2 + \dots + d_{2p}u_p \\ \vdots \\ y_q = c_{q1}x_1 + c_{q2}x_2 + \dots + c_{qn}x_n + d_{q1}u_1 + d_{q2}u_2 + \dots + d_{qp}u_p \end{cases}$$

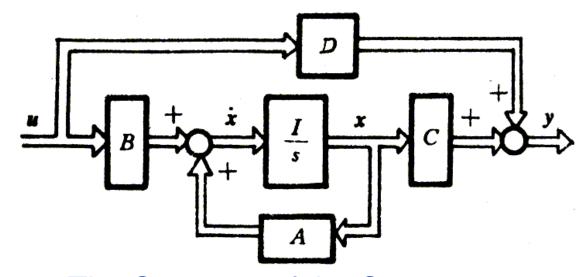

The Matrix representation:

$$y = \mathbf{C}x + \mathbf{D}u$$

State-space equations of Linear Time-Invariant (LTI) System:

$$\dot{\mathbf{x}}(\mathbf{t}) = \mathbf{A}\mathbf{x}(\mathbf{t}) + \mathbf{B}\mathbf{u}(\mathbf{t})$$

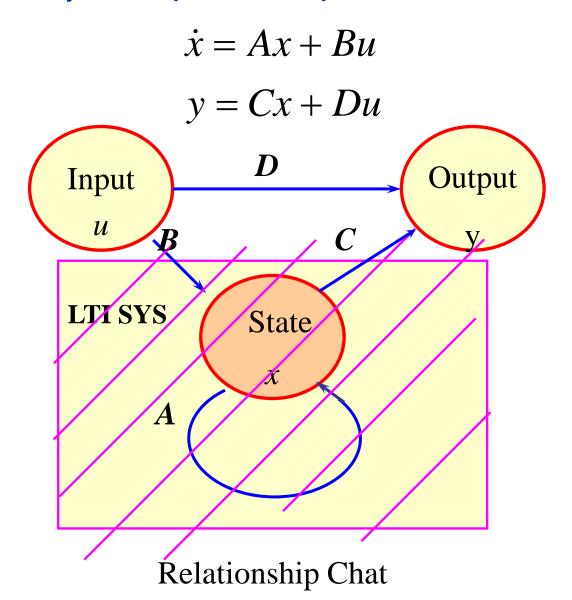

$$y(t) = Cx(t) + Du(t)$$

The Structure of the State-space

- A State Matrix (Systems matrix, coefficients matrix)
- B Input Matrix (Control Matrix)
- C Observing Matrix (Output Matrix)
- D Feedforward Matrix (Directly Transfer Matrix)

The LTI system: {A, B, C, D}

Advantage of State-space Analysis Method:

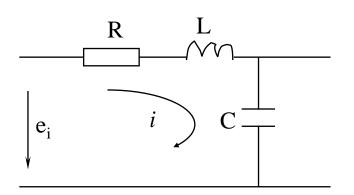

- Computing: Using computer to solve the first-order differential equations, easier than higher order equation;
- Representation: Using Vector Matrix to simplify the mathematic representation of the differential equations;
- Field: MIMO System, Time-Invariant System, Stochastic Process and Sample System, etc.
- Special: the use of the state space representation is not limited to systems with linear components and zero initial conditions.

9.2.2 Examples

Ex. 9-1 RLC electric circuit 's State-space model (figure).

Physics relationship:

$$L\frac{di}{dt} + Ri + \frac{1}{c}\int idt = e_i$$

If assume $e_i(t)$ is the input: u(t), i(t) is the output: y(t), and select the proper state-variables i(t) and $\int i(t) dt$:

$$x_1(t) = i(t)$$

$$x_2(t) = \int i(t)dt$$

$$\frac{dx_1(t)}{dt} = -\frac{R}{L}x_1(t) - \frac{1}{LC}x_2(t) + \frac{1}{L}u(t)$$

$$\frac{dx_2(t)}{dt} = x_1(t)$$

$$\frac{dx_1(t)}{dt} = -\frac{R}{L}x_1(t) - \frac{1}{LC}x_2(t) + \frac{1}{L}u(t)$$

$$\frac{dx_2(t)}{dt} = x_1(t)$$

Rewrite to State equations:

$$\begin{bmatrix} \dot{x}_1(t) \\ \dot{x}_2(t) \end{bmatrix} = \begin{bmatrix} -\frac{R}{L} & -\frac{1}{LC} \\ 1 & 0 \end{bmatrix} \begin{bmatrix} x_1(t) \\ x_2(t) \end{bmatrix} + \begin{bmatrix} \frac{1}{L} \\ 0 \end{bmatrix} u(t)$$

$$A \qquad B$$

 $y(t)=i(t)=x_1(t)$, thus we have Output equation:

$$y(t) = \begin{bmatrix} 1 & 0 \end{bmatrix} \begin{bmatrix} x_1(t) \\ x_2(t) \end{bmatrix} \qquad \dot{x}(t) = Ax(t) + Bu(t)$$
$$y(t) = Cx(t)$$

Not the end!!!!

Furthermore!!!!

 $L\frac{di}{dt} + Ri + \frac{1}{c}\int idt = e_i$

If select some another state variables:

select some another state variables:
$$x_1 = \frac{1}{C} \int i dt + Ri, x_2 = \frac{1}{C} \int i dt$$
 then
$$x_1 = x_2 + Ri, \quad L \frac{di}{dt} + x_1 = e_i$$
 we have
$$\begin{vmatrix} \dot{x}_1 = \dot{x}_2 + R \frac{di}{dt} = \frac{1}{RC} (x_1 - x_2) + \frac{R}{L} (-x_1 + e_i) \\ \dot{x}_2 = \frac{1}{C} i = \frac{1}{RC} (x_1 - x_2) \\ y = \frac{1}{R} x_1 - \frac{1}{R} x_2$$
 tate-space
$$\begin{vmatrix} \dot{x}_1 \\ -\frac{1}{RL} - \frac{R}{L} \end{vmatrix} = \frac{1}{RC} \begin{vmatrix} x_1 \\ -\frac{1}{RC} \end{vmatrix} \begin{bmatrix} x_1 \\ -\frac{1}{RC} \end{bmatrix} \begin{bmatrix} x_1 \\ -\frac{1}{RC} \end{bmatrix}$$

State-space representation:
$$\begin{bmatrix} \dot{x}_1 \\ \dot{x}_2 \end{bmatrix} = \begin{bmatrix} \frac{1}{RL} - \frac{R}{L} & -\frac{1}{RC} \\ \frac{1}{RC} & -\frac{1}{RC} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} + \begin{bmatrix} \frac{R}{L} \\ 0 \end{bmatrix} u$$
$$y = \begin{bmatrix} \frac{1}{R} & -\frac{1}{R} \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ 0 \end{bmatrix} \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_1 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_1 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_1 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_1 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_1 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_1 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_1 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_1 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_1 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_1 \end{bmatrix} = \begin{bmatrix} x_1 \\ x_1$$

Comparison:

$$A = \begin{bmatrix} -\frac{R}{L} & -\frac{1}{LC} \\ 1 & 0 \end{bmatrix} \qquad B = \begin{bmatrix} \frac{1}{L} \\ 0 \end{bmatrix} \qquad C = \begin{bmatrix} 1 & 0 \end{bmatrix}$$

$$A = \begin{bmatrix} \frac{1}{RL} - \frac{R}{L} & -\frac{1}{RC} \\ \frac{1}{RC} & -\frac{1}{RC} \end{bmatrix} \qquad B = \begin{bmatrix} \frac{R}{L} \\ 0 \end{bmatrix} \qquad C = \begin{bmatrix} \frac{1}{R} & -\frac{1}{R} \end{bmatrix}$$

Conclusion: State-space is non-unique.

- State-variable is not unique. Different state-equations
- State-equation is not unique. Different state-variable

with

1st selection:
$$x_1(t) = i(t)$$

$$x_2(t) = \int i(t)dt$$

2nd selection:
$$\overline{x}_1 = \frac{1}{c} \int idt + Ri$$

$$\overline{x}_2 = \frac{1}{c} \int idt$$

we have

$$x_1 = \frac{1}{R}\overline{x}_1 - \frac{1}{R}\overline{x}_2$$
$$x_2 = c\overline{x}_2$$

matrix representation:

ation:
$$x = \mathbf{P}\overline{x}$$
 in which $\mathbf{P} = \begin{bmatrix} \frac{1}{R} & -\frac{1}{R} \\ 0 & c \end{bmatrix}$

Infinite groups of state-variables x are available by any different nonsingular matrix (非奇异阵) P.

1st selection:
$$x_1(t) = i(t)$$

$$x_2(t) = \int i(t)dt$$

2nd selection:
$$\overline{x}_1 = \frac{1}{c} \int idt + Ri$$

$$\overline{x}_2 = \frac{1}{c} \int idt$$

we have

$$x_1 = \frac{1}{R}\overline{x}_1 - \frac{1}{R}\overline{x}_2$$
$$x_2 = c\overline{x}_2$$

matrix representation:

ation:
$$x = \mathbf{P}\overline{x}$$
 in which $\mathbf{P} = \begin{bmatrix} \frac{1}{R} & -\frac{1}{R} \\ 0 & c \end{bmatrix}$

Infinite groups of state-variables x are available by any different nonsingular matrix (非奇异阵) P.
